Sightline Prompter

The teleprompter that works with your AI.

A see-through desktop teleprompter for speakers, content creators and learning teams recording to camera.

By a speaker, for speakers. By a content creator, for content creators.

Your words. Your pace. A traditional teleprompter, with voice control and voice following or steady scrolling. Keep your script near the lens, with slides or a call behind it.

From script to handover

- **Prepare:** open Markdown, Word, PDF or a Google Docs link. Optional scripting directives steer sections, stops, beats and markers.
- **Present:** use voice, phone, keyboard or a floating pad. Fit text, contrast and mirroring to your setup.
- **Review:** hand over take references, keeper choices and estimated word alignment with your master recordings.

Your favourite AI

Your assistant can prepare scripts and, through an authorised local agent, configure and control Sightline. It can interpret the edit pack too. AI remains optional.

Preparation and control in 1.2.0

Align the shared guide manually or with local position feedback. Check audio, review a short test and save a reference. Recover controls from the bottom hover tab.

Optional OBS, Stream Deck 0.2.0 and local MCP connect the tools you choose, with explicit permissions.

Your recording tool stays

Your recorder supplies production video/audio. Optional scratch audio supports sync; live timings and captions need review. Check the real picture, sound and capture route.

> **Sightline 1.2.0 + Stream Deck 0.2.0 · 4 November 2026.** Download both from the app release. Marketplace review is separate. Windows is unsigned; Mac is ad-hoc signed and unnotarised. The download page links illustrated installation help. Check your recording and sync route.

Free, and always will be. No Sightline account or subscription. Local speech works offline after the model download. Optional Deepgram sends audio online; AI services have their own terms.
